Meeting Aug 19, 2026 at 02:54 UTC

Summary

Meeting focused on defining system modules, architectural requirements, and prioritizing web application development for tenant management.

System Architectural Overview

The system structure comprises a Super Admin dashboard, Tenant dashboard, and Rider app to manage fleet metrics. Development strategies prioritize essential business features via a phase-wise delivery model.

Operational and Security Standards

Role-based access controls define specific permissions for administrators and staff. Financial operations, including standard 5,000 deposits and weekly payment cycles, require customization to optimize recovery workflows.

Scope and Implementation Decisions

Phase 1 development is strictly limited to a web application, excluding mobile development to ensure focus. The team prioritized manual vehicle registry implementation to ensure accurate database tagging.

Decisions

Aligned

- **Security deposit fixed at 5,000** The standard security deposit for vehicles is fixed at 5,000.
- **Weekly rider payment cycle adopted** The rider payment cycle is set as weekly, replacing the previously considered monthly cycle.
- **Late payment fee set at 100** The late payment fee for riders is established at 100.
- **Fraud and blacklisting protocol established** The fraud and blacklisting protocol requires a descriptive text field, with the final decision on vehicle recovery resting with the tenant admin.
- **Fleet owner inquiry form retention** The fleet owner inquiry form will be retained and included within the web application.

We've **updated the Decisions section** using your feedback.

Let us know what you think: [Helpful](#) or [Not Helpful](#)

Next steps

- ☐ [Ashok Talur] Share Database Details: Provide the database schema or a mock of existing paper based fleet records to the development team.
- ☐ [Ashok Talur] Share Onboarding Form: Share the design and required fields for the fleet owner onboarding registration form.
- ☐ [Ashok Talur] Present Service Workflow: Present the detailed service engineering workflow and field engineer management system during the next meeting.
- ☐ [Sumukh Kulkarni] Propose UI Guidelines: Draft and propose multiple visual design options including color and font guidelines for the application interface.

- ☐ [Sumukh Kulkarni] Send Work Split: Distribute the phase 1 work breakdown based on insights gained from the meeting.
- ☐ [Sumukh Kulkarni] Schedule Meeting: Create and send a calendar invitation for a follow-up discussion on Friday.

Details

Did the screenshots in this section make your notes [better](#) or [worse](#)?

- **Administrative Setup and Meeting Protocols:** Ashok Talur initiates the meeting to establish high-level protocols for sharing slides and conducting Q&A sessions, expressing a preference for utilizing screen-sharing features.
- **System Overview:** Ashok Talur outlines three primary system modules: the Super Admin dashboard, the Tenant dashboard, and the Rider app. The Tenant entity is defined as a separate company entity purchasing a subscription, while the Rider is associated with the Tenant.

- **Super Admin Dashboard Overview:** The Super Admin dashboard is designed to monitor total active and inactive tenants, riders, and vehicles through data

charts. It includes a 30-day platform overview and alerts for subscription renewals and SLA breaches.

- **Tenant Performance and Scalability:** Ashok Talur describes the tenant performance hierarchy, which includes Starter, Growth, and Enterprise plans based on fleet size. The interface must support scalability for up to 100 tenants through specialized UI panels to manage growth.
- **Tenant Management and Development Strategy:** The tenant management section will track active, travel, or suspended statuses and subscription models. Ashok Talur suggests a phase-wise delivery strategy, prioritizing critical business features while pushing enhancements to later phases.
- **Performance Analytics and System Integration:** System features will include performance analytics, fleet utilization, and revenue collections. Ashok Talur notes that global admin dashboards can manage tickets related to general app functionality, while tenant-specific issues must remain isolated; integration plans include WhatsApp, SMS gateway, KYC providers, and accounting systems.
- **Role-Based Access Control:** Sumukh Kulkarni confirms that the role-based access control document, specifically section 4, defines the permitted actions for the three identified roles: Super Admin, Provider Admin (tenant admin), and Provider Staff.
- **Tenant-Level Dashboard and Fleet Status:** The Tenant dashboard provides visibility into fleet status, including active, repair, recovery, and service request metrics. Ashok Talur notes that 24 vehicles are currently pending recovery, and 392 service requests require analysis.
- **Maintenance and Utilization Tracking:** Maintenance tracking is prioritized because vehicle life is tied to utilization days rather than just the purchase date. Ashok Talur highlights the importance of battery life monitoring, noting that vehicles older than one or two years generate higher service costs and lower revenue.

- **Rider App Features:** The Rider app serves as a core module, featuring rider and vehicle information, payment history, and document management, including insurance, chassis, and registration details. Inventory management, such as spare parts like headlamp assemblies and control units, will be tracked through service requests.

- **Backend Database Alignment:** Sumukh Kulkarni requests access to the current paper-based database records to ensure the new backend design aligns with existing data structures and prevents migration issues. Ashok Talur agrees to consult with stakeholders about sharing this data or providing a prototype.
- **Marketing Page and Onboarding:** A public-facing marketing page will be developed to allow fleet owners to request custom demos and view business benefits. Once onboarded, data will be manually entered by the Super Admin into the "Add Tenant" section.

- **Security Deposit Standards:** The standard security deposit for a vehicle is set at 5,000. Ashok Talur clarifies that deposit amounts may vary based on vehicle type and risk, such as the cost of a charger, though 5,000 is the current fixed standard.
- **Payment Cycle Customization:** Payment cycles operate on a weekly basis, from Monday to Monday, with Thursday designated as the due date for collections. Ashok Talur specifies that this system must be customizable to allow for staggered reminders and collection dates to optimize the recovery workload.
- **Investment and Revenue Tracking:** The team discusses the need to track both total investments—including purchase, repairs, and insurance—and revenue generated at the individual vehicle level to calculate profitability. They

plan to address the division of investment responsibilities between the Super Admin and fleet owners in a future meeting.

- **Fraudulent Rider Handling and Blacklisting:** A reporting system will be implemented where Tenant Admins can submit details and custom reasons for blacklisting a rider. While a rider may be marked as fraudulent, the Tenant Admin retains the final decision to block them or continue operations. Once blocked, the rider's roles and permissions within the app will be disabled.
- **Vehicle Hardware Specifications:** Ashok Talur confirms that the current fleet is equipped with GPS trackers and smart locks. The team plans to discuss additional upstream data connectivity in the next meeting scheduled for Friday.
- **Field Engineering and Design Guidelines:** The team discusses the management of field engineers, noting that tenants may have their own or utilize a predefined set of service roles provided by the Super Admin. Ashok Talur agrees to bring details on service workflows to the next meeting. Finally, the team agrees that the UI design should focus on being functional and visually appealing, with no finalized application name yet.
- **Phase One Application Scope:** Sumukh Kulkarni clarifies that the scope for the first phase of the project is strictly limited to a web application designed for office-based administrators, explicitly excluding the development of a mobile application.
- **Fleet Owner Inquiry Form Integration:** Regarding the fleet owner inquiry form, Sumukh Kulkarni suggests moving it from the web application to the global domain. However, Ashok Talur decides to keep the form within the web application, allowing for user enrollment and the entry of details, noting that this approach better facilitates the process of managing inquiries before potential clients engage with the system.
- **Vehicle Registry Implementation:** Sumukh Kulkarni proposes that the Phase One release include a vehicle registry feature where a tenant owner or super admin can perform manual chassis number entry to ensure data is tagged correctly in the database. Ashok Talur agrees with this plan and instructs that they proceed with tuning the implementation.
- **Project Planning and Scheduling:** Sumukh Kulkarni commits to reviewing the meeting details and sending out a document outlining the work split for the first

phase. Additionally, Sumukh Kulkarni arranges to send out an invitation for a follow-up meeting on Friday to continue the planning process.

- **Tenant System Onboarding:** Near the conclusion of the discussion, Abhiram R identifies the tenant system onboarding as the top priority for the project.
